TITLE OF INVENTION: Nucleic Acids, Proteins, and Antibodies
FILE REFERENCE: PJZ05PCT
CURRENT APPLICATION NUMBER: PCT/US01/01309
CURRENT FILING DATE: 2001-01-17
Prior application data removed - refer to PALM or file wrapper
NUMBER OF SEQ ID NOS: 384
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 222
LENGTH: 401
TYPE: PRT
ORGANISM: Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match 42.0%;

    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

The enzyme is primer independent, and produces soluble glucan from sucrose. A gene encoding the enzyme may be cloned and expressed in Escherichia coli using a subclone of phage lambda-C13, e.g. plasmid pGSG501 or plasmid pGSG502. The DNA may also be expressed in a transgenic plant, to improve the level of stored carbohydrate in a pasture plant which normally contains low levels, or to prevent degradation of stored carbohydrate during plant senescence. Dextran may be isolated from the plant, for use as a food binder or pharmaceutical additive. Primer independence ensures that the enzyme will be functional in plants. The glucan is poorly degraded in plants but easily degraded by bacteria in the rumer
The DNA sequence from Streptococcus sobrinus strain 6715 encoc glucosyltransferase-I (and mutants). The DNA was obtd. by tre S. sobrinus 6715 with mutanolysin, extracting the chromosomal partially digesting with Sau3AI and fractionating on agarose 9 The 3-5 kbp fragment was ligated into pUC18 and E. coli JM109 transformed with it. A GT-1 expressing clone was isolated and
                                                                                                                                                                                                                                                                                                                                                                                                              Streptococcus

                                                                                                                                                                                                                           This invention describes a novel nucleic acid molecule (I) encoding alternan sucrase (E.C. 2.4.1.140 - an enzyme, that belongs to the glucosyltransferase group) The recombinant, purified alternan sucrase gene is useful for the fermentative production of alternan (a carbohydrate) and/or fructose by secreting the enzyme into a saccharose-containing culture medium. Alternatively, the enzyme is contacted with a saccharose-containing solution. The alternan and/or
                                                                                                                                                 fructose is then isolated from the medium. Cosmetic products or foodstuffs containing alternan can be produced. Recombinant production alternan sucrase is advantageous as it provides a cost effective means
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      syrup
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding recombinant Leuconostoc mesenteroides alternan sucrase protein and methods of alternan and fructose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAB10667
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequenced. The dental caries.
Sequence
                                              producing fructose for high fructose containing syrups, production of which previously has been achieved by costly production from maize starch. This sequence represents the Leuconostoc mesenteroides altern sucrase protein which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim la; Page

                                                                                                                                                                                                                                                                       the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ota T,

CC encoding human secreted proteins (AAW88534 to AAW88756). The secreted concoding human secreted proteins (AAW88534 to AAW88756). The secreted concoding human sequences are deposited with the ATCC under deposit numbers (CC ATCC 97979, 97974, 97975, 97976, 97977, 209007, 209008, 209009, 209010, (CC 209011, 209080, 209081, 209082, 209083, 209083, 209084, 209085, 209511. Host (CC cells comprising recombinant vectors containing the nucleic acid (CC cells comprising recombinant production of the secreted (CC sequences are used for the recombinant production of the secreted (CC proteins. The polynucleotide and amino acid sequences are useful for are (CC useful for gene therapy, Pathological conditions can be also (CC by protein or gene therapy, Pathological conditions can be also (CC or by determining the amount of the new polynucleotides. (CC or by determining the presence of mutations in the new polynucleotides. (CC or by determining the presence of mutations in the new polynucleotides. (CC or by determining the presence of mutations in the new polynucleotides.) (CC or by determining the presence of mutations in the new polynucleotides. (CC or by determining the presence of mutations in the new polynucleotides. (CC or by determining the presence of mutations in the new polynucleotides.) (CC or by determining the presence of mutations in the new polynucleotides.) (CC or by determining the presence of mutations in the new polynucleotides.) (CC or by determining the presence of mutations in the new polynucleotides.) (CC or by determining the presence of mutations in the new polynucleotides.) (CC or by determining the presence of mutations in the new polynucleotides.) (CC or by determining the presence of mutations in the new polynucleotides.) (CC or by determining the presence of mutations in the new polynucleotides.) (CC or by determining the presence of the new polynucleotides.) (CC or by determining the presence of the new polynucleotides.) 
                                                                                       Matches
                                                                                                         Query Match

                                                                                                                                      The invention relates to a method for predicting responsiveness of a patient to treatment with a type I interferon. The method comprises determining the level of one or more proteins with a 646, 164, 126, 59 98, 177, 761, 361, 941, 657, 817, 429, 473, 399, 285 or 303 amino acid sequence fully defined in the specification after treatment with a type I interferon. The method allows a physician to determine whether a patient suffering from chronic viral hepatitis, neoplastic disease or relapsing remitting multiple sclerosis will respond favourably to Type I interferon treatment via oromucosal administration. The present sequence is one of the polypeptides listed above that may be used in the method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; interferon-alpha induced gene; type I interferon treatment; chronic viral hepatitis; relapsing remitting multiple sclerosis; neoplastic disease; SEC 63.

                                                  The sequence represents an alpha-D-glucosyltransferase from Streptococcus salivarius. The enzyme is primer independent, and produces soluble glucan from sucrose. A gene encoding the enzyme may be cloned and expressed in Escherichia coll using a subclone of phage lambda-Cl3, e.g. plasmid pGSG501 or plasmid pGSG502. The DNA may also be expressed in a transgenic plant, to improve the level of stored carbohydrate in a pasture plant which normally contains low levels, or to prevent degradation of stored carbohydrae.

The DNA was obtd. by treating S. sobrinus 6715 with mutanolysin, extracting the chromosomal DNA, partially digesting with Sau3AI and fractionating on agarose gel. The 3-5 kbp fragment was ligated into pUC18 and E. coli JM109 transformed with it. A GT-1 expressing clone was isolated and sequenced. The clone may be used in the development of a drug for

                                  fructose is then isolated from the medium. Cosmetic products or foodstuffs containing alternan can be produced. Recombinant production alternan sucrase is advantageous as it provides a cost effective means producing fructose for high fructose containing syrups, production of which previously has been achieved by costly production from maize starch. This sequence represents the Leuconostoc mesenteroides alternar
                                                                                                         This invention describes a novel nucleic acid molecule (I) encoding a alternan sucrase (E.C. 2.4.1.140 - an enzyme, that belongs to the glucosyltransferase group) The recombinant, purified alternan sucrase gene is useful for the fermentative production of alternan (a carbohydrate) and/or fructose by secreting the enzyme into a saccharose-containing culture medium. Alternatively, the enzyme is contacted with a saccharose-containing solution. The alternan and/or

                                                                                                                                                    The present sequence is the Lawsonia intracellularis flagellar hook
C protein FigE. The present invention describes an isolated or recombinant
C polypeptide (I) that comprises, minics or cross-reacts with a B- or
T-cell epitope of a FigE (flagellar hook) polypeptide from a
Lawsonia spp. (I) has antibacterial activity, and induces a specific
humoral immune response. (I) are used as antigens in vaccines to prevent
or treat infection by Lawsonia, in birds and animals, especially pigs,
C to raise specific antibodies (Ab) and to detect past or present
infection. Ab are also useful in diagnosis, to detect L. intracellularis
or immunologically cross-reactive species, also for identification of
epitopes in FigE. Vectors that contain nucleic acids (II) encoding (I)
as primers or probes for detecting L. intracellularis or related
microorganisms, in hybridisation or amplification assays.
